

Renovation of a data center, UZ Gasthuisberg Leuven

Because of the growing need for current, cooling and surface area in the extending IT-department, UZ Leuven decided to renovate and reorganise the existing 'Azuur' data centre.

The data centre could not be expanded in terms of current and cooling. Besides, during the expansion the data centre had to remain standby, and this was not an easy task. A totally new technical infrastructure was studied and is planned for execution. The electricity supplies were studied by Deerns while the energy aspect and HVAC installation were studied by Ingenium.
