

The Saint John hospital in Bruges - Future data center V-block

The Saint John hospital in Bruges renewed its redundant data centre due to the expansion of applications.

The Saint John hospital in Bruges renewed its redundant data centre and has now two full-fledged data centres. After examining the possibilities it was decided to keep this redundant data centre on the site. The white space is approximately 200 m² and meets the Tier 3 requirements. The challenge in this was to house the data centre in a basement containing already technical installations. In addition, a fiberglass network was laid out and a new high-voltage cabin was installed. All this in order to achieve Tier 3 level.
